

## Post-Commissioning Flu

As dust begins to accumulate in the corners, you begin to see a little rust, or maybe just as the season changes, your bioenergy system will behave differently. Hopefully, your operations staff is trained and prepared to adjust the system as necessary to bring it back on course. Cavanaugh can support you and your operations staff in the methodical diagnosis of the performance lags, and the implementation of corrective actions that result in as-expected performance. The corrective actions may range from simple operational parameter adjustment to additional preventative maintenance, to perhaps even replacement of some components that still *work*, they just don't work *well*. We will develop a cost-benefit comparison that will lead to not only make good decisions, but wise ones.
